CINERADIOGRAPHIC RATINGS

HOW TO USE CINERADIOGRAPHIC CHARTS

General: With the Cineradiographic rating chart we can determine the maximum allowable kW of the Cine pulse, or with a given kW determine maximum time in seconds the Cine run can progress.

The Most common way of using the charts is to determine maximum time of any expected Cine run and maximum duty factor. With a known duty factor and Cine run time kW can easily be determined.

Definition of Terms

Time in seconds: Total time of one Cine run, usually 5 to 12 seconds.

Duty Factor in Percent (DF%): Actual time during one second the x-ray tube is producing x-rays. If we select a 4 msec pulse width and 60 exposures per second the x-ray tube will be producing x-rays for a total of 240 msec each second or 24% of the time. The higher the DF number, the more load placed on the x-ray tube.

Peak Pulse Power: Peak energy in watts of any one Cine Pulse. Can be any combination of kV and mA allowed by Radiographic and Filament Emission curves.

Example: 80 kV at 400 mA equals

$$\frac{80{,}000\ \text{V} \times 400\ \text{mA}}{1000} = 32{,}000\ \text{W or } 32\ \text{kW}$$

USING THE CINE RATING CHARTS:

G-2090 150 Hz 3 Phase 1.0 Focal Spot

Example: Determine maximum kW allowed with the following known factors:
Maximum Pulse Width ..... 4 msec
Exposures per Second 60
Maximum Cine Run Time ....10 seconds

Calculate Duty Factor: (DF%)

$$\text{DF\%} = \frac{\text{Pulse Width (mSec)} \times \text{Frames per Second}}{10}$$

$$\text{DF\%} = \frac{4\ \text{msec} \times 60\ \text{exp/sec}}{10} = \frac{240}{10} = 24\%$$

Refer to Rating Chart

G-2090 150 Hz 3 Phase 1.0 Focal Spot:

At bottom of chart find 10 second line. Move vertically to intersection with 24% DF curve. Make a horizontal reference to left side of rating chart and note kW rating of 60 kW.

We now know each pulse during the cine run can have a maximum rating of 60 kW under conditions given in example.

kW = kV x mA. The kW of the exposure can be any combination of mA and kW allowed by the Radiographic and Filament Emission Charts.

The Cine rating charts are usable to maximum anode heat content.

ANGIOGRAPHIC RATINGS

HOW TO USE ANGIOGRAPHIC CHARTS

General: Serial Radiography puts a severe demand on the x-ray tube due to the large number of exposures made in rapid succession. Intervals between exposures are fixed and so short that it is not possible for the anode track to cool to any extent during the exposure series. Therefore, the temperature of the anode track increases from exposure to exposure. The kW values used in the angiographic charts have been determined to prevent damage to the anode. The angiographic rating charts are usable to maximum anode heat content and are based on a starting anode heat content of 70% or less.

Definition of Terms

Number of Exposures in Series: The number of exposures made in succession or the number of exposures made during one contrast injection.

Exposure Rate: The number of exposures made per second. For a series of exposures where the exposure rate changes, it must be assumed that all exposures will be made at the maximum rate. For example, if during a series 10 exposures will occur at one per second and 30 exposures at 4 per second, use the kW ratings in the 40 exposure column at 4 per second rate.

Exposure Time: Time in seconds of Each exposure.

USING THE CHARTS:

Select Correct Chart:

0.3, 0.6 or 1.0 Focal Spot
Note: 150 Hz rotor speed recommended for all angiography.

Determine the number of exposures in Series: With cut film angiography the number of exposures are known, however in Digital Angiography the number of exposures commonly are not known. When determining the number of exposures, assume worst case or past history.
Note: Most angiographic x-ray tubes fail from under-estimating the number of exposures made in a series.

Determine kW of each exposure in Series: Referring to chart —find block under "Number of Exposures in Series" that is greater than or equal to expected number of exposures in Series. On left side directly opposite this block under "Exposure Rate per Second" column, select maximum rate per second that will be used for the exposure series. At the intersection of exposure rate and exposure time in seconds, find maximum kW allowed for each exposure.

For Example: 80 pkV and 500 mA = 40 kW

Example: From chart G-2090 150 Hz 3 Phase
1.0 Focal Spot, determine kW allowed with following known factors.
Maximum number of exposures 40
Exposure time .050 second (50 milliseconds)
Maximum Exposure per second 4

From chart find 40 exposure block. On left side directly opposite this block under "Exposure Rate per Second" column, select 4 exposures per second. Find .050 seconds at top of chart. At intersection of exposure rate line and exposure time, find 59.5 kW.

Nota:
1. (kW) De exposición se calcula multiplicando mA x kV-por ejemplo: 70 kV x 300 mA = 21 kW.

Note:
1. (kW) of Exposure Equals mA x kV. For Example: 70 kV x 300 mA = 21 kW.
2. Exposures less than .010 seconds will have a kW rating same as .010 seconds.

Remarque:
1. (kW) en exposition égale kV x mA. Par exemple: 70 kV x 300 mA = 21 kW.
2. Les expositions inférieures à 0.010 sec. ent les mémes valuers en kW que celles de 0.010 sec.

Anmerkungen:
1. (kW) der Belichtung is gleich mA x kV Zum Beispiel: 70 kV x 300 mA = 21 kW.
2. Belichtungen von weniger als .010 Sekunden haben die gleichen kW Werte wie die von .010 Sekunden.

Nota:
1. (kW) De exposición se calcula multiplicando mA x kV-por ejemplo: 70 kV x 300 mA = 21 kW.
2. Para exposición de menos de .010 segundos, el resultado en (kW) seria lo mismo que el de .010 segundos.

Note:
1. (kW) of Exposure Equals mA x kV. For Example: 70 kV x 300 mA = 21 kW.
2. Exposures less than .010 seconds will have a kW rating same as .010 seconds.

Remarque:
1. (kW) en exposition égale kV x mA. Par exemple: 70 kV x 300 mA = 21 kW.
2. Les expositions inférieures à 0.010 sec. ent les mémes valuers en kW que celles de 0.010 sec.

Anmerkungen:
1. (kW) der Belichtung is gleich mA x kV Zum Beispiel: 70 kV x 300 mA = 21 kW.
2. Belichtungen von weniger als .010 Sekunden haben die gleichen kW Werte wie die von .010 Sekunden.

Nota:
1. (kW) De exposición se calcula multiplicando mA x kV-por ejemplo: 70 kV x 300 mA = 21 kW.
2. Para exposición de menos de .010 segundos, el resultado en (kW) seria lo mismo que el de .010 segundos.

Note:
1. (kW) of Exposure Equals mA x kV. For Example: 70 kV x 300 mA = 21 kW.
2. Exposures less than .010 seconds will have a kW rating same as .010 seconds.

Remarque:
1. (kW) en exposition égale kV x mA. Par exemple: 70 kV x 300 mA = 21 kW.
2. Les expositions inférieures à 0.010 sec. ent les mémes valuers en kW que celles de 0.010 sec.

Anmerkungen:
1. (kW) der Belichtung is gleich mA x kV Zum Beispiel: 70 kV x 300 mA = 21 kW.
2. Belichtungen von weniger als .010 Sekunden haben die gleichen kW Werte wie die von .010 Sekunden.

Nota:
1. (kW) De exposición se calcula multiplicando mA x kV-por ejemplo: 70 kV x 300 mA = 21 kW.
2. Para exposición de menos de .010 segundos, el resultado en (kW) seria lo mismo que el de .010 segundos.

Stator Power:

Time to full speed of the anode is a function of the power rating of the "starter" and the weight / diameter of the anode. All Varex Imaging stator types are rated for regular speed and high speed starters.

Immediately following high speed anode rotation, the rotor speed must be reduced to 4000 r/min or less within 10 seconds using a suitable dynamic braking device.

No more than two high speed starts per minute are permissible. The starting voltage must never exceed 600 volts rms.

Puissance du stator:

Le temps nécessaire à la montée en pleine vitesse est fonction de la puissance du démarreur et du poids/ diamétre del'anode. Tous les stators Varex Imaging sont prévus pour une vitesse normale et pour une vitesse rapide.

Immédiatement aprés la rotation à 4000 t/min ou moins en 10 secondes en utilisant un système de freinage dynamique approprié.

Pas plus de deux demarrages rapides par minute sont autorisés. La tension de démarrage ne doit jamais excéder 600 volts rms.

Statorleistung:

Die Zeitspanne bis zur vollen Geschwindigkeit des Anodentellers ist eine funktion aus der Nennleistung des Anlaufgerätes und Gewichtes bzw. Durchmessers des Tellers. Alle Varex Imaging stator sind für hoch- und normaltourigen Betrieb ausgelegt.

Unter Verwendung einer geeigneten Anogenbremse muß die Drehzahl nach hochtourigem Betrieb unmittelbar auf weniger als 4,000 U/min verreduziert werden. Es sind nicht mehr als zwei Hochleistungsstarts pro minute zulässig. Die Anlaufspannung darf hiebei 600 volt nicht überschreiten.

Poder de la Bovina:

La velocidad maxima del anodo giratorio es obtenida por el poder del arrancador y es relacionado con el peso y diametro del anodo. Todos las bovinas de Varex Imaging son usadas con velocidad regular y velocidad alta al principio.

Immediatamente despues de obtener la velocidad alta del anodo giratario, la velocidad del rotador debe der reducida a 4000 r/min ó menos en 10 segundos usado un sistema dunamico y apropiado para reducir la velocidad.

El rotador no debe ser expuesto a velocidades altas no mas de dos (2) veces por minuto. El voltaje inicial no debe excedir 600 voltios rms.
